

What The AI Visibility Toolkit Fixes In This Audit

SGD Communications audit alignment summary based on the April 20, 2026 report.

Executive Summary: The audit identifies two types of gaps: **entity/distribution gaps** and **website content gaps**. The AI Visibility Toolkit directly addresses the entity/distribution side through schema injection via GTM, local listing sync, citation management across 50+ sites, and an ongoing social posting platform. These improvements strengthen how Google, ChatGPT, Gemini, Perplexity, Siri, and other systems validate the business. They do **not** replace the need for deeper service-page copy, FAQs, or About-page content.

Toolkit Capability	Audit Issues It Fixes	Why It Matters
Schema injection through GTM	Fixes the report's missing structured data gaps, including Organization, LocalBusiness, sameAs, hasCredential, AggregateRating, Service, FAQPage, and BreadcrumbList schema where applicable.	This gives search engines and AI systems machine-readable business identity, trust signals, service data, and relationship data they can actually parse.
Local listing sync	Directly addresses NAP inconsistency, weak local business validation, and fragmented location signals across the web. Helps standardize the primary phone, address, and business details everywhere they appear.	Consistent listings improve local trust, reduce entity ambiguity, and help the business qualify more reliably for map, assistant, and recommendation-style results.
Proper citations on 50+ sites	Supports the report's missing citation and entity-confirmation layer by creating consistent business references across trusted directories and business sources. Reinforces business name, location, category, and contact data.	More corroborating citations increase confidence in the business entity, strengthen local authority, and improve the chance of being surfaced in AI-generated local recommendations.
Social posting platform	Helps address weak freshness signals, limited social reinforcement, and underdeveloped off-site presence. Supports a more active digital footprint tied to the business entity and service market.	Ongoing social publishing creates recency signals, brand reinforcement, and more supporting content around the business for both users and AI systems to discover.

Audit items the toolkit directly supports: ? No Organization / LocalBusiness schema ? No sameAs declarations for social profiles ? License and credibility signals not formalized ? Missing AggregateRating / supporting trust markup ? NAP inconsistency across channels ? Weak local validation and citation footprint ? Limited freshness and social reinforcement signals	Audit items that still require website/content work: ? Thin service pages ? Missing FAQ content and buyer Q&A; copy ? Weak About page depth and named-expert content ? Lack of city-specific service pages ? Missing answer-first sections and comparison content
--	--

Bottom line: the AI Visibility Toolkit solves the technical entity, citation, listing, and visibility infrastructure gaps identified in this report. It strengthens how the business is understood and corroborated across search and AI systems, while the website itself still needs stronger page-level content to fully capitalize on those signals.
